

# Measurement, tracking and verification (Scope 3)

## Is this you?

You need to start reporting on your all your scope 3 emissions, but don't know where to start. You already report on scope 3, but would like to make the process more efficient. You want to track the impact of your reduction initiatives. You require 3rd party verification of your Greenhouse Gas (GHG) inventory, to demonstrate the integrity of your climate reporting.

## Benefits abound

Report your value chain emissions with confidence and track your progress towards your climate targets. Integrate you GHG inventory with your business information systems and produce the data you need, when you need it.

## The world is changing

The net zero challenge means taking into account your indirect upstream and downstream (scope 3) greenhouse gas emissions, in addition to direct (scope 1 and 2) emissions. Measuring scope 3 emissions can be complex, requiring specialist skills as well as a focus on data management, to avoid being overwhelmed with data. The ultimate aim should be to integrate scope 3 reporting into routine business information systems, rather than it being a predominantly manual process each year.

## How we help

We set up reporting methodologies and systems that will allow you to report on scope 3 emissions. We update your GHG inventory annually on your behalf, assist you in doing it yourselves, or provide 3rd party verification.
