

Net zero carbon audit for improved building performance

Is this you?

You want to know what you need to do to each of your buildings to reach your net zero targets and at what cost. You want to understand what the impact will be and how your building will perform against industry benchmarks.

Benefits abound

Understand the maximum engineering potential of your asset, based on current asset business plans. With a definitive implementation plan to decarbonise the asset, you will have confidence that you know what needs to be done and in what order, and the full and marginal investment required over time to achieve this.

The world is changing

Investor demand for assets which are responsibly and sustainably managed is increasing. Knowing which interventions to make, when to make them and the financial impact of these investments is becoming an ever greater differentiator in the market.

How we help

- We provide insights through in-depth analysis.
- We identify interventions necessary for your specific asset to develop a carbon reduction pathway; this includes a clear action plan for implementation, and associated costs.
- We then map the impact of these interventions against your internal targets and industry benchmarks.
