Sustainability and Energy  
Management

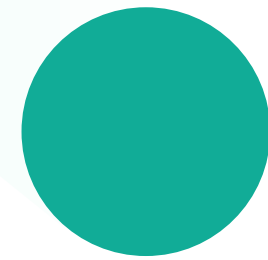

# Energy efficiency plan service

## Is this you?

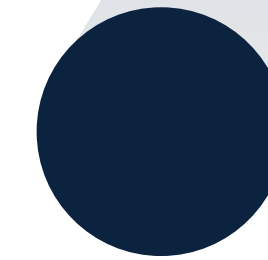

You are a telco, media or tech player with energy-intensive infrastructures (networks, data centres, campuses/offices) that need to reduce OPEX and meet net zero or ESG targets.

## Drivers

There are multiple factors driving the need for strategic energy efficiency including- energy price volatility, new regulation and disclosure ((CSRD/ESRS, EPBD, ETS2); pressure from customers and investors; as well as financing requirements linked to environmental KPIs.

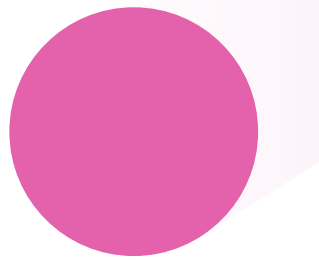

## How we help

We support every stage from strategy to execution. With proprietary analytics and strong experience on large, multi-site networks.

- Baseline and KPI definition;
- assessment of savings potential by site/cluster;
- portfolio of measures (e.g., cooling and power quality optimisation, LED/lighting energy-saving analyses, IoT for monitoring);
- investment roadmap with business cases;
- support with implementation and certifications (e.g., ISO 50001).

## Benefits

- Measurable consumption and cost reduction with clear payback,
- improved ESG ratings,
- greater operational resilience,
- readiness for grants/incentives.
